

5G-CLOPS: Cross-Layer Optimization in 5G Networks

Investigadores:

- Universidad de Granada ([UGR](#) [1]), Universidad de Extremadura ([UEX](#) [2]), Fundación [COMPUTAEX](#) [3].

Idioma Sin definir

Descripción:

This ground-breaking proposal precisely suggests an holistic approach in which network resources allocation in the UE-BS (User Equipments and Base Stations) association is undertaken by taking into consideration not only the propagation channel condition but also the operation of the IP mobility management protocols that allow a seamless mobility and avoid service disruption during the user's movement among heterogeneous networks. This cross-layer solution could lead to a better utilisation of the network resources and to an optimised network performance. The goal is to devise a set of specialized metaheuristic algorithms for 5G networks capable of scheduling ultradense networks (UDNs) efficiently and engineering mechanisms for the automatic service management of SDN/NFV-based (Software-Defined Network / Network Function Virtualization) access networks.

Fuentes de financiación:

Proyecto financiado por el [Ministerio de Ciencia, Innovación y Universidades](#) [4] en la convocatoria de Proyectos I+D+i "Retos Investigación" del Programa Estatal de Investigación, Desarrollo e Innovación Orientada a los Retos de la Sociedad.
